

## What does treatment look like?

The Tanner Airway Appliance is a removable device that helps to develop the jaws up and forward. Used on patients 2-75 years old. With 6-12 months of treatment, you will have space for your adult teeth to come in and a healthy jaw position with no extractions or surgery needed. Within this process of developing your jaws you will create a more optimal airway and will be set up for a lifetime of healthy sleep.

# What is Airway Orthodontics?

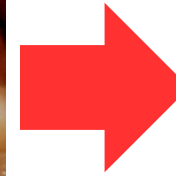

Most people are referred to an orthodontist for crowding. Some are referred to surgery for jaw alignment or extractions.

## Crowding

Extreme Crowding Before Treatment

Before

## There is another solution!

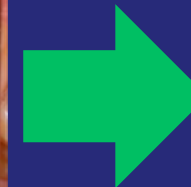

Tanner Airway Orthodontics is about more than just straight teeth. Our approach to orthodontics takes into account the whole health of our patients.

Do you suffer from any of these symptoms?

After treatment, no extractions needed.

After

In cases of severe crowding removing permanent teeth is a common solution. With Tanner Airway Orthodontics, we **recommend keeping all permanent teeth** and developing the jaw so there is **room for the teeth**.

Downward and backward growth creates a narrow profile and restricts the airway. **By developing the jaws up and forward the airway improves** and we help to make a strong and beautiful jaw line.

Trouble Sleeping

Fatigue
