

# What does treatment look like?

- The Tanner Airway Appliance is a removable device that helps develop the jaws up and forward
- For patients age 2-78
- 6-12 months of treatment
- Space for adult teeth, a healthy jaw position, and a more optimal airway

**Why to start  
early airway  
orthodontic  
treatment on  
your child.  
(Starting at age 2)**

*Straight Teeth, Healthy Airway  
Happy Child*

By the time most parents are referred to see orthodontic treatment, their child already has crowded teeth. This means that their child could already be experiencing the effects of underdeveloped jaws.

## Making space for all of the teeth!

It may appear that the child to the left has perfect baby teeth, but will they have space for adult teeth?

**NO.**

Does your child suffer from any of these symptoms?

Trouble Sleeping

ADD/ADHD

Snoring

Frequent Sickness

Fatigue

Grinding/Clenching

The picture to the left is the same child after treatment. If the jaws are developed at a young age, the adult teeth will have space to come in straight.

**WHAT IF THERE WAS A REASON?  
And the answer is simple....YOUR  
CHILD NEEDS THE ABILITY TO  
BREATHE BETTER!**

### Why does my child grind and clench their teeth?

When someone's breathing is disrupted, their body tries hard to find a jaw position that allows them to breathe well. This results in grinding, clenching, and worn down teeth.

### Why does my child have trouble listening?

A struggle of many parents is getting their child to concentrate and listen. What is there was a reason they had a hard time concentrating and no amount of parenting classes or discipline was the answer? There is a good change your child is not getting good quality sleep. Every human needs sleep to function optimally. By developing the jaws, we are creating space for your child to get the oxygen they need to have a restful night sleep and refreshed day!
